What is a password manager?
A service or feature that stores and autofills your credentials.

LITS highly recommends using a dedicated password manager service, rather than one built-in to a browser.

Why? How are they different?

Common Features
- Securely store usernames, passwords, and other information
- Automatically store newly created accounts
- Securely autofill credentials when logging in
- Generate unique, complex, secure passwords

How do I use a password manager?
The following is a generalization and may not apply to all managers. The following screenshots were taken from LastPass.

- Passwords are stored in a centralized Vault

- The Vault is accessed via desktop...

...or mobile
The Vault is unlocked with a master password.

Logging into a new website prompts the manager to automatically store the credentials.

Stored credentials will autofill when you login into that site.
Popular options

- LastPass
- 1Password
- Dashlane
- Bitwarden
